ABSTRACT

The volume of oats marketed has declined in recent years, and interregional movements are relatively small in comparison to those of other major grains. Nevertheless, moving the crop from its highly concentrated production region to points where it is used requires a significant transportation capacity. To provide a basis for policy and investment decisions affecting the U.S. grain transportation system, detailed information on movements of oats and other grains during 1977 was collected from 3,500 grain merchandising, processing, and exporting firms in 41 states. Survey data on receipts and shipments for each state or substate area were expanded to represent total volumes for those areas and were verified by comparison with information from secondary sources. The data, which represent the most comprehensive and accurate information available on movements of oats, are presented and summarized in this bulletin.

Keywords: Grain flows, grain shipping, grain transportation, interregional analysis, oats, oat marketing.

This publication reports the results of research conducted by three regional technical committees: Southern Regional Committee S-115 on Alternative Structures for Increasing Efficiency in Intra- and Inter-regional Grain Marketing Systems; North Central Regional Committee NC-137 on Evaluation of Alternative Rural Freight Transportation, Storage, and Distribution Systems, and North Central Regional Committee NC-139 on Economic Analysis of the U.S. Grain Exporting System. The following state Agricultural Experiment Station representatives, Tennessee Valley Authority (TVA) staff members, and U.S. Department of Agriculture personnel comprised the technical committees.

Preface

The research reported in this bulletin is the first effort ever made to survey grain shippers and receivers nationwide; it is the most comprehensive study of grain movements ever conducted. Members of the technical committees, including representatives of Agricultural Experiment Stations in 25 states, assisted in conducting an industry survey to collect flow data for wheat, corn, soybeans, sorghum, oats, barley, and rye. In addition, surveys were conducted in 16 other states through contracts with 15 universities located in those states. The industry surveys were coordinated by Lowell D. Hill, Department of Agricultural Economics, University of Illinois at Urbana-Champaign. The data were tabulated and summarized under the supervision of Mack N. Leath, Economics and Statistics Service, U.S. Department of Agriculture. The success of this research project is due to the cooperation of thousands of grain marketing firms and the efforts of researchers in the many participating states.

The research was funded in part through contract DACW 72-78-C-0005 with the Institute of Water Resources, U.S. Army Corps of Engineers. Supplemental support was provided by the Federal Railroad Administration of the U.S. Department of Transportation, the Maritime Administration of the U.S. Department of Commerce, and the St. Lawrence Seaway Development Corporation. Administration of grant funds was coordinated by Lowell D. Hill, University of Illinois at Urbana-Champaign.

Oat Movements in the United States

Interregional Flow Patterns and Transportation Requirements in 1977

INTRODUCTION

Information about the origin and destination of grain produced in the United States and about the modes of transportation used to convey it is important for many policy and investment decisions. Although data on the quantities of grains shipped abroad from each port are available and statistics on the amount of grain shipped on the inland waterways are published annually, little information has been available that can be used to match origins with destinations and to identify the mode of transportation used.

Through personal interviews with over 3,500 grain merchandisers, processors, and exporters throughout the United States, data on origins, destinations, and transport modes have now been assembled for corn, wheat, soybeans, sorghum, oats, barley, and rye. This publication summarizes the data for oats. Other publications in this series provide similar information for the other grains.

Oats are the third most important feed grain produced in the United States. Although annual production has averaged about 600 million bushels in recent years, the total supply available decreased each year during the 1970s except for 1977-78 (Table 1). The amount of oats used for human consumption during that decade was nearly constant at about 42 million bushels annually. The amount used for seed is almost totally a function of the acreage planted; it has accounted for about 40 million bushels annually.

The principal domestic use of oats is for livestock feed. The amount used varies greatly from year to year in response to changes in the relative price and supply of oats as compared to other feed grains. During the 1970s, the annual usage for feed generally exceeded 500 million bushels.

The smallest and most unstable component of the annual demand for oats has been the export demand. Export shipments of oats decreased from 57 million bushels in 1973-74 to an estimated 4

million bushels in 1979–80. Exports have averaged only 10 million bushels annually during the marketing years from 1975–76 to 1979–80.

The volume of oats that must be transported is relatively small in comparison with other grains. Oats are less dense (more bulky) than other grains and consequently are usually processed or fed to livestock near the area where they are produced. Oat production is concentrated in the northern Great Plains and the western Corn Belt (Figure 1). The area of concentrated production extends from eastern South Dakota to Lake Michigan.

In 1977, oat production in the U.S. totaled 753 million bushels. Minnesota and South Dakota produced 302 million bushels, two-fifths of U.S. production (Table 2). Iowa and Wisconsin accounted for another fifth of the U.S. total. In contrast to the other major feed grains, over 60 percent of the oats produced in 1977 were used for seed and livestock feed on the farms where they were produced; less than 300,000 bushels were sold from farms. Sales by farmers in Minnesota and South Dakota alone accounted for almost 49 percent of all such sales in 1977.

PURPOSE OF STUDY

Analysis of grain flow patterns can reveal the geographical nature of grain markets and the types of transportation services required by the grain industry. This information is useful to grain firms in identifying additional marketing opportunities and in making decisions about where to locate new handling, storage, and processing facilities.

Of equal importance is the value of this information to those who set federal and state transportation policies. The formulation of rational grain transportation policies depends upon knowledge of existing grain flows and associated transportation modes. In many situations, firms or public agencies make decisions affecting the production, storage, and transportation of grain without adequate information about grain distribution patterns and the demands that those decisions will place on the various transportation modes. The objectives of this study were:

1. To determine the volume of oats moving between various origins and destinations

Figure 1. Acreages of oats harvested in 1974.

2. To determine the extent to which the various transportation modes are employed in the movement of oats in the U.S.

METHODOLOGY

For the purposes of this study, the United States was divided into 132 numbered regions and 31 ports, as shown in Figure 2. Data for the 31 ports were aggregated into 13 port areas located in four major export regions. The specific ports included in each port area are listed with their identifying numbers in Table 3.

Flow data for oats were collected for the 1977 calendar year primarily through personal interviews with representatives of grain handling, storage, and processing firms in 41 states. The firms from which data were obtained included country elevators, inland terminal elevators, river terminal elevators, feed manufacturers, export elevators, commercial feedlots, and processors. A representative from each state's Agricultural Experiment Station was responsible for drawing the sample and conducting the interviews.

The sampling of inland grain elevators in the particular state was carried out by listing the elevators in descending order of storage capacity. Starting with the largest, elevators were added to the sample until the total of their storage capacities was equal to at least 25 percent of the inland elevator storage capacity in that state. Not less than 10 percent of the remaining elevators were then selected at random. For river elevators the procedure was simpler: a minimum of 50 percent of the elevators were selected by random sampling.

Feed manufacturing firms in each state were arrayed on the basis of their production capacity. Starting with the largest, feed firms on the list were added to the sample until the total of their production capacities equalled or exceeded 10 percent of the total feed manufacturing capacity in the state. Ten percent or more of the remaining firms were then selected at random and included in the sample. All exporters and processors were included in the interviews.* Data based on random samples were expanded in proportion to the sampling rate to convert the data into estimates for the entire region or state.

The same types of information were gathered from all of the grain handlers and processors interviewed. Each firm was asked to identify the volume of oats that it received from each region and

* Only one major processor did not provide data for the study. Data on receipts by that firm were estimated from information furnished by shippers.

^a These port areas will be used in this report to avoid disclosure of data from individual firms.

the volume received by each mode of transportation. The firms were also asked to identify each region or port area for which their shipments were destined and the quantity shipped by each mode.

Agricultural Experiment Station representatives verified the accuracy of the data collected, expanded the sample data to state totals, and delivered the summary data for each grain and for every substate region to the U.S. Department of Agriculture for processing. As receivers' and shippers' data were tabulated, the Experiment Station representative in each state checked any discrepancies to identify potential data errors and to arrive at a single number for each origin-destination pair. Insofar as possible, the state representatives checked the data for each shipment to ascertain that they were consistent and logical.

VERIFICATION OF DATA

The accuracy of the data on the volume of oats shipped between the various origins and destinations by each mode of transportation was verified by several direct and indirect comparisons with data from other sources. One indirect check was made by totaling interstate shipments and subtracting from that value the total of interstate receipts for each state to determine how closely the results agreed with the surplus or deficit calculated for the state.* Exact correspondence was not expected since the quantities used by livestock feeders and processors were estimated rather than determined from actual consumption data. Any major discrepancies, however, were investigated to verify that they did not indicate significant errors in the survey data.

A second check on total volume was made by comparing total receipts at each port with official data on inspections for export as published by the Market News Service of the U.S. Department of Agriculture (Table 4). Because there were few opportunities for either set of data to miss significant volumes, these numbers compared very closely. Discrepancies between receipts and exports at some of the port areas were explained by shipments to domestic destinations from export elevators, shipments to processing plants located in the port area, and changes in inventory between the beginning and end of the year. There were, however, some unexplained differences between export shipments

* The surplus or deficit for each state was calculated by adding the 1977 production to the stocks in all positions as of January 1, 1977, then subtracting the estimated amount used for livestock feed, processing, and seed and deducting the stocks in all positions as of January 1, 1978.

reported by survey respondents and published data on inspections for export.

Supplemental information about grain shipments on inland waterways was provided by the U.S. Army Corps of Engineers. Since these data were based on the actual bill of lading for each shipment, they were, in principle, a complete census of all barge shipments. As Table 5 shows, the survey data and the Corps of Engineers data on state-to-state shipments on inland waterways correspond closely for all originating states except Minnesota. Differences between the two sets of data can be explained in part by (1) a significant number of shipments for which the origins and destinations are noted as "unknown" in the Corps data, (2) changes in the destination of a barge after it left the loading dock, (3) incomplete reporting of loadings to the Corps of Engineers, and (4) errors in reporting by survey respondents. Differences for shipments from Minnesota were mainly a result of the destination not being known at the time of shipment.

The last method of validation provides important insight into U.S. Department of Transportation data based on a 1 percent sample of all rail bills of lading. These data were expanded to develop estimates of

^a Shipments to unknown destinations are excluded.

annual shipments and receipts in each state and then compared with the rail shipments reported by survey respondents (Table 6). Some similarities are apparent, but there are also many major differences. In contrast to the situation for other grains, the estimates developed from the 1 percent waybill sample were substantially higher than the survey estimates for Iowa and South Dakota. Additional analysis of both data sets led to the conclusion that there are serious sampling errors in the waybill statistics and that those data should therefore be used with caution. These results also suggest that sampling errors may be present in the survey data for oats. It is possible that in several states certain elevators that specialize in oats were not included in the sample drawn.

The comparisons between various data sources generally increase the confidence in the accuracy

of estimates derived from sampling a less than perfectly identified population. The logic of each flow reported in these tables has been checked by the university person that organized the survey in each state. Where internal inconsistencies were found, the data and the sampling rates were adjusted with assistance from grain specialists and industry personnel in the state. The flow estimates presented in the following sections represent the best information available on the actual volume of oats transported between the regions of the United States.

OVERVIEW OF MOVEMENTS

This section summarizes selected data and presents a general overview of oat movement patterns. Detailed data on receipts and shipments for each region and port are presented in the last section of this bulletin.

Shipments and Receipts by State

Grain marketing firms in the United States reported shipping about 228 million bushels of oats in 1977. About 53 percent of that amount moved to destinations within the states in which it originated. Much of the total amount, of course, is accounted for by the same grain being shipped in sequence by several firms.

Intrastate shipments for each state and mode of transportation are summarized in Table 7. Trucks, the predominant mode of transportation, carried about 43 percent of the total intrastate shipment volume. Rail shipments accounted for about 35 percent of the total, and 22 percent was sold to local farmers. A large portion of the intrastate movements consisted of shipments from country elevators to terminal elevators for storage and reshipment. Movements within Minnesota accounted for almost one-half of the total volume of intrastate shipments in the United States. Sizeable movements also occurred within Iowa and Nebraska.

The patterns of interstate oat flows to domestic destinations are illustrated in Figure 3. In contrast to intrastate movements, the predominant mode of transportation used for interstate shipments was the railroad, which carried 52 million bushels, or almost 49 percent of the total volume (Table 8). Almost one-fourth of the volume moving by railroads originated in Minnesota. Pennsylvania, Tennessee, and Wisconsin were the principal destinations for these shipments. North Dakota and South Dakota also originated substantial rail shipments, most of which were destined for Minnesota.

Note: These data include shipments to port cities within the state but not exports to destinations outside the United States.

^a This column reports sales by elevators to farmers within the state. Not all states included farm sales in their survey questionnaires, so these data are incomplete and underestimate total shipments to farmers.

Figure 3. Patterns of oat flows to domestic destinations in 1977.

Several states reported sizeable interstate truck shipments. Most of these shipments moved relatively short distances to adjacent states, where some of the grain was used by feed processors and some was stored in terminal elevators and later reshipped to other destinations.

Barges carried only 12 percent of the oats shipped across state lines. Minnesota originated over three-fourths of the total volume shipped in the U.S. by barge. Several southeastern states were important destinations for Minnesota's barge shipments and also for those originating in Illinois and Iowa.

Note: These data include shipments to port cities but not exports to destinations outside the United States. Movements to ports from each state are shown in Table 10.

^a This column reports sales by elevators to farmers located in other states. Not all states included farm sales in their survey questionnaires, so these data are incomplete and underestimate total shipments to farmers.

^b Barge shipments from Wisconsin are included with shipments from Minnesota to avoid disclosure of individual firms' operations.

About one-third of the oats shipped to Louisiana by barge were later reshipped to Florida.

The volume of oats received in each state from other states is shown in Table 9. Minnesota (including the Duluth-Superior port area) was the predominant destination. Minnesota and Wisconsin were the most important markets in the Midwest, whereas Pennsylvania and Louisiana were the leading markets in the East and South, respectively. Other states receiving more than 5 million bushels from interstate origins were California, Kentucky, Missouri, and Oklahoma.

Movements to Ports

Table 10 shows the amount of oats that moved to port locations from each of the originating states by the three modes of commercial transportation. Figure 4 illustrates the pattern of these movements. Almost two-thirds of the volume of oats that moved to ports originated in Minnesota and North Dakota. Receipts at the Great Lakes export region accounted for about 58 percent of the total amount received by all ports. Nearly 48 percent of the oats shipped to ports went by rail, and Minnesota and North Dakota originated the largest volume of rail shipments. Iowa shipped a significant amount by rail and ranked third among all states that originated rail shipments of oats to port regions. Thirty-four percent of the oats shipped to port regions went by truck. Oregon shipped the largest amount by truck, accounting for over 39 percent of the 7 million bushels that moved by truck to ports. Less than four million bushels were shipped by barge to export regions; about 86 percent of that amount originated in Minnesota.

Figure 5 shows each state's share of the total volume of oats shipped to export regions. Minnesota shipped the greatest amount, originating 39.5 percent of the total volume. North Dakota and Oregon also shipped significant volumes, ranking second and third, respectively, among states that shipped oats to port areas. Together, these two states accounted for over one-third of the total volume moving to export locations.

An estimated 20 million bushels of oats were received at all port areas in 1977, of which 8.3 million bushels were inspected for export. (Table 11). The remainder was processed, reshipped to other destinations, or retained as increased inventory at port elevators. About 96 percent of the oat exports were handled by port elevators in the Great Lakes region, and Duluth-Superior, the principal port area for oat exports, accounted for all of that volume.

The Louisiana Gulf area ranked second in volume; 324,000 bushels were inspected for export in that area.

Foreign Destinations for U.S. Exports

Oats shipped from the various origins to a specific port area are commingled at the port elevator. It is not possible to trace the movement of oats from a particular state through the port system to their final destination, and therefore no attempt was made to determine whether a particular ocean vessel was loaded with, for example, Minnesota oats or North Dakota oats. It is nonetheless of interest to examine one more link in the market chain that connects U.S. farmers with foreign feeders and processors.

The destination countries for oats exported from the major export regions of the United States are shown in Table 12. In 1977, the Federal Republic of Germany (West Germany) purchased 4.7 million bushels, or over 56 percent of the total volume exported, making that nation the leading buyer of U.S. oats. The Netherlands, the next largest buyer, received about 1.8 million bushels in 1977. All other purchasing nations received less than 1 million bushels each.

RECEIPTS AND SHIPMENTS BY AREA

Estimates of the flow of oats by each mode of transportation and for every study region are presented in Tables 13-159. Receipts and shipments at each port area are listed in Tables 160-169. Data for substate areas were aggregated into totals for an entire state in cases where volumes were small or where publishing the data for a substate area would have revealed the operations of an individual firm. These estimates represent the most comprehensive and best data available on the volume of oats transported between each of the regions of the United States.

A detailed study of the flows will likely lead some readers to the conclusion there are inefficiencies in the shipment of oats among states. Shipping oats in both directions between two states is one example of an apparent inefficiency in the marketing pattern. However, most of the shipments reported in this study reflect sellers' attempts to take advantage of profitable marketing opportunities that occur at a particular moment. It is not possible to provide a rationale for all of the movements without complete

^a Oats were not shipped from Atlantic and Pacific regions during 1977.

frequent changes in the most profitable shipping pattern.

The availability of storage space at harvest time is also an important factor in determining oat shipments. If local storage facilities are filled with wheat when oats move from the farms, country elevators may be forced to ship oats to various terminal locations such as Minneapolis for storage. If these movements are made by rail under rates with transit privileges, this grain is committed to moving to domestic and export points beyond the terminal location. Later in the year supplies in the local region may be exhausted, and feed mills and livestock feeders in that area will begin purchasing oats from outside sources, reversing the earlier outbound flow. Many other factors, such as the availability of transportation, have a substantial impact on oat movements. An inadequate supply of rail cars during periods of peak movement may force oats to flow in a pattern that is not the most economical.

A detailed analysis of the influence of these factors is beyond the scope of this publication. Readers interested in more detailed information about the types of firms involved in oat movements and the seasonality of those movements should contact Agricultural Experiment Station representatives in the participating states.
